Process mining enables organizations to run in-depth process analysis driven by their own data. By scanning the electronic event logs of your organization's IT systems, process mining can help you identify patterns and trends within those systems, and serve up game-changing insights into the way your business works. This helps you make better decisions, faster.

By identifying the root causes of poorly performing processes, detecting and visualizing compliance violations, monitoring process performance, and supporting collaborative action on critical cases and performance bottlenecks, process mining allows you to gain insight into your process operations without the money and time investment of typical data analytics projects.

A [recent survey](#) of chief executives from 50 global businesses revealed nearly half expected to have their business significantly disrupted by new technology within ten years. Understanding precisely how your business processes work in practice can make all the difference when the rules of the game change!

Automated analysis

Deep diving into an organization's existing business processes has typically been time-consuming and expensive, relying on highly-skilled external personnel and a sometimes unhealthy dose of intuition. In contrast, with modern process mining solutions, you can automatically analyze your existing system process data, enabling you to visualize the exact processes that make up your business.

Game-changer: Instead of hiring and relying on expensive consultants or data analysts, use the simple and intuitive Signavio Process Intelligence interface to understand and analyze your own business processes.

Compliance requirements

Many businesses operate in an ever-changing regulatory environment, and keeping track of the range of standards and policies your business is required to comply with can be challenging. Process mining can tackle this challenge by helping you make conformance checks based on your own real data. This ensures you not only know how the processes in your organizations are executed, but also if this execution complies with the internal and external rules you are required to follow.

Game-changer: Ensure peace of mind, and use Signavio Process Intelligence to automatically check if your business processes comply with organizational and regulatory requirements.

Detecting variance

Process mining helps you to establish baseline information about the way your business processes work, and compare this to the way your business processes should be working. You can then identify where specific processes or sets of processes (called traces) differ from the baseline. In turn, this allows you to quickly determine what actions may be required to correct the variances.

Game-changer: Use Signavio Process Intelligence to quickly and clearly visualize your business processes, allowing you to identify inefficiencies or bottlenecks and deal with them immediately.

Continuous improvement

Once you have fixed critical causes for bottlenecks, unnecessary costs and risks, you can move on to addressing issues of lesser importance that still create significant costs, or keep you from further increasing your revenue. Process mining can be used in an iterative way, helping you to build more and more detailed records of your business data, thus ensuring you are able to identify future issues quickly, and respond immediately.

Game-changer: Instead of spending time and money on one or two big data analysis projects, use Process Intelligence to continuously monitor your business processes and make ongoing improvements to the way you work.

Collaboration

Process mining presents you and your colleagues and staff with an accurate picture of how your business is operating. However, even with this information, different staff members can have different views on the solution to a problem. Providing a space to jointly discuss the business processes discovered through process mining, and develop an action plan, is therefore vital to successfully implementing any changes. Your goal should be to move as quickly as possible from identifying a problem, to implementing a collaborative solution.

Game-changer: Instead of acting in isolation, use Process Intelligence to develop a storyboard of how your business operates, then turn this into a collaborative action plan which you can share with the rest of your team immediately, in real time.
