Chart Key

Average Rating

Average rating based on reviews

Views

Number of total page views

Comparisons

Number of times compared to another product

Reviews

Total number of reviews on IT Central Station

Followers

Number of followers on IT Central Station

The total ranking of a product, represented by the bar length, is based on a weighted aggregate score. For **Views**, **Comparisons**, **Reviews**, and **Followers** the score is calculated as follows: The product with the highest count in each area gets the highest available score of 17.5 points. Every other product gets assigned points based on its total in proportion to the #1 product in that area. For example, if a product has 80% of the number of reviews compared to the product with the most reviews then the product's score for reviews would be 17.5% (weighting factor) * 80% = 14. For **Average Rating**, the maximum score is 30 points awarded linearly based on our rating scale of 1-10. If a product has fewer than ten reviews, the point contribution for **Average Rating** is reduced (one-third reduction in points for products with 5-9 reviews; two-thirds reduction for products with fewer than five reviews). Reviews that are more than 24 months old, as well as those written by resellers, are completely excluded from the ranking algorithm.

What is Business Process Management?

Business process management (BPM) is an area where IT and business (theoretically) work together to make an organization’s workflows more effective and efficient. BPM has become more prominent in recent years as organizations have expanded and grown more complex – creating a need for managers to build coherent process workflows that touch multiple systems. BPM software brings it all together, enabling business analysts to collaborate with IT and orchestrate business process steps that invoke different underlying systems.

BPM is one of those concepts that sounds great, and has truly strong potential but is notoriously hard to implement well. As a result, members of IT Central Station emphasize usability as a key selection factor when deciding which BPM solution to buy. Users want fast results and easy deployment from BPM tools. On the end user front, [powerful wizards](#), for example, can streamline workflow design and automation processes. The best BPM tools provide mechanisms for capturing business processes. This minimizes the repetitive, error-prone process of transposing business analysts’ observations into BPM requirements.

On the back end, admins and architects want the [ability to integrate with other systems](#) like SAP, Oracle and so forth. BPM platforms have to be flexible, modeling business processes transversely to all areas of a company. The toolset should ideally accept multiple data types and offer rules-based decision workflow capabilities. There should be logical modeling and embedded programming within BPM libraries. Task components ought to be [reusable](#) for the sake of efficiency.

Some users express a desire for BPM software packages to support Business Process Model and Notation (BPMN), a standard for the graphical representation for describing business processes. Specifically, IT Central Station members expect a BPM suite to support [BPMN 2.0](#), the latest version, from modeling through execution. In the best case scenario, the tool won’t create extra work for developers. Users like [real java-like hooks](#) into development of the business process model to help developers easily build integrations. Members prefer BPM that doesn’t use any type of [proprietary scripting language](#).

IBM BPM

IBM

Sep 22 2017

[Paul Parisi](#)

Consultant

Enterprise Architect at a tech consulting company with 501-1,000 employees

What do you think of IBM BPM?

Since the blue-washing of Lombardi, IBM has introduced three variations on the core BPM product in order to provide different entry level costs to customers based on the how they intend to use the product suite. These levels are defined as Express Edition Standard Edition Advanced Edition Broadly speaking Express and Standard differ in how the customer is allowed to use the technology where Advanced edition differs in that it allows customers to use WebSphere Process Server (WPS) capabilities which have now been integrated into the technology suite (this includes Integration Designer which is the new WebSphere design too and also Business Spaces) Update: IBM is introducing additional changes to BPM Advanced edition that will result in a further divergence...
